

Presentation

Curio's presentation preferences

Scaling Options

Choose whether the idea spaces should be scaled to fit the screen, or if scroll bars should appear as needed to scroll around the window. If the mouse pointer is visible then you can click anywhere in the idea space to scroll around, as well. You can toggle this on-the-fly during the presentation by pressing the S key.

Check “Use minimum idea space bounds” if the unused bottom and right portions of the idea space should be cropped off when the idea space is displayed. If unchecked, then the entire idea space is displayed including unused portions.

When Done Options

Check “Exit presentation after last slide” if the presentation should immediately end if you try to progress past the last slide, otherwise the presentation will remain on the last slide.

Selection Options

Click the color well to change the selection color that is used to highlight any selected figures (note that the pointer must be visible to select figures).

Transition Options

You can take advantage of native, Core Image Filter, and Quartz Composer transitions when using presentation mode. You can even create your own custom Quartz Composer compositions and place them in your ~/Application Support/Curio/Transitions directory and they'll be available within Curio, see the section above on Presentation Mode Quartz Composer Transitions for details. The set transition will be used between all slides of the presentation.
