

# Geometry

*The shape of your shape*

---

Let's start by selecting this figure then click the Inspector toolbar button, then click the Geometry tab on the far right.

At the top you see the x and y location of this figure, along with its width and height. The proportional checkbox is automatically checked for images which means when you resize an image the width and height keep the same proportionals.

The natural size (shortcut is to just tap the n key) will restore a text or image figure to its natural size instead of wrapping text or manually sizing an image to a different size.

You can rotate the selected figure here or hold ⌘ while dragging on the figure's resize handles.

Using the red struts and green springs within the layout control you can determine how the figure will move or resize with the idea space. You can stick a figure to the top right corner of the idea space or have it centered at the bottom, resizing and repositioning as the idea space sizes.

The distribution controls can be used to move the figure from back to front, flip an image upside down, align edges, or distribute across an idea space.
